

Robustness Training Methods: SR2L vs DR vs Combined

(Which training approach handles different failure modes best?)

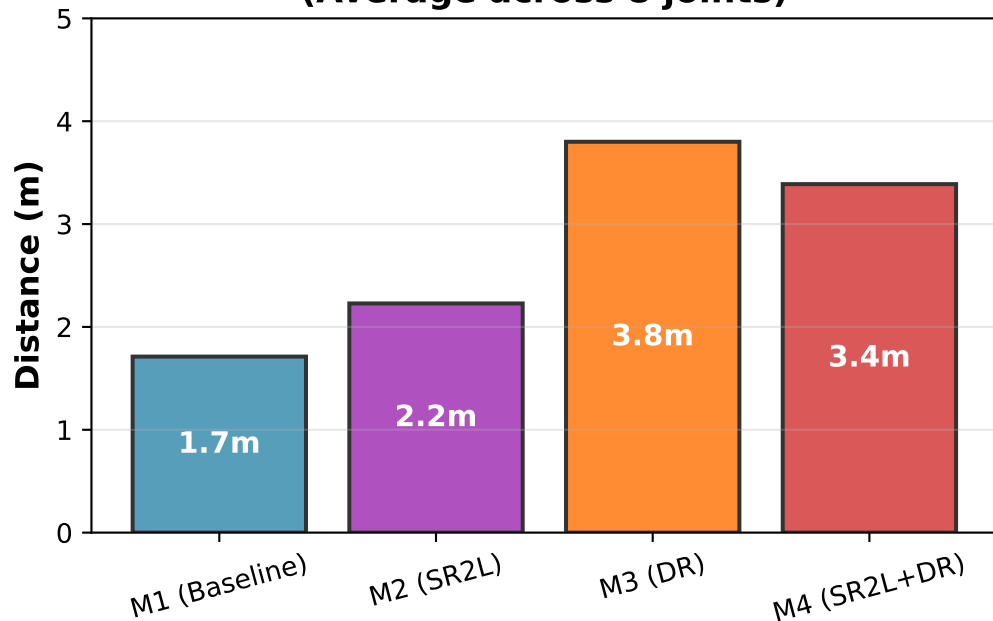

(a) Baseline Performance
(No Failures)

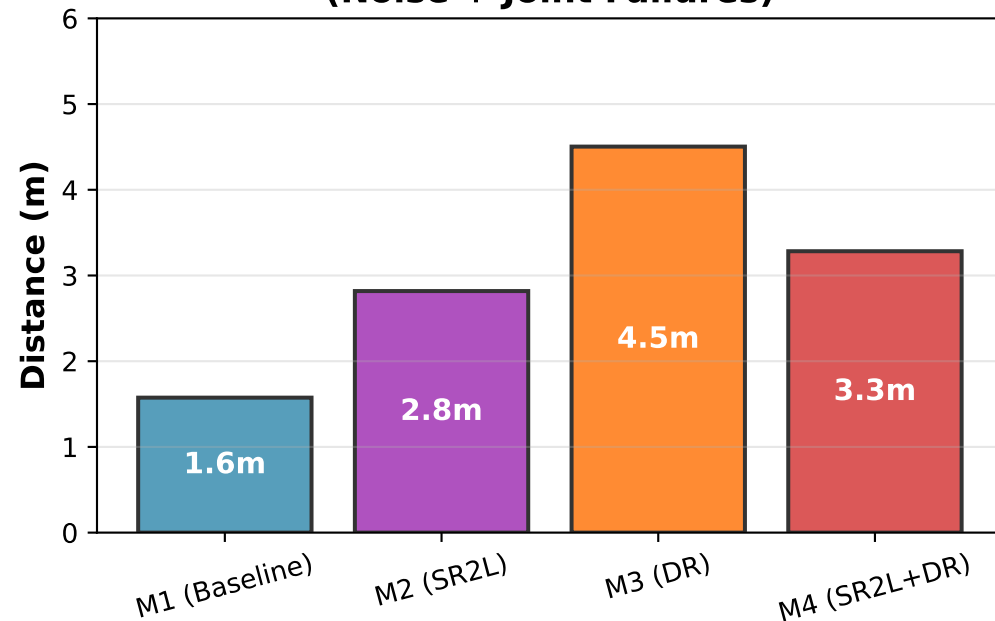

(b) With Sensor Noise
($\sigma=0.10$, 10 $\times$ training level)

(c) With Joint Failures
(Average across 8 joints)

(d) Combined Stress
(Noise + Joint Failures)

KEY FINDINGS: M3 (DR) best overall | M2 (SR2L) excels at noise | M4 (Combined) shows NO SYNERGY
